                                                                                                        The invention describes a novel method of identifying viral DNA of human papilifomavirus (HPV) in cellular material collected from an individual. The method comprises extracting DNA from the cellular material, amplifying the DNA by using a polymerase, and identifying sequences complementary to sequences in the regions E (early genes) e.g. E6 and E7 cells is now based on identification of a nucleotide sequence in the L1 identify the presence of HPV virus in every stage of infection and to distinguish between virus strains having low hazard and virus strains region of middle-high hazard. This is the primer used to identify the E6 hazard and virus strains region of middle-high hazard HPV strains in infected cells, described in

The invention relates to a method for preparing a stabilised reaction CC mixture which contains at least one enzyme and which is at least CC matrially dried. The method involves removing the water from an aqueous reaction mixture containing an enzyme and a three-component stabiliser CC solution until the residual moisture content is 30% or less. The CC agent which protects against dessication, an inhibitor of condensation CC groups, and an inert polymer that forms a mesh structure that inhibits the method in the dried reactants. The dried reaction mixtures can be custed as "ready-to-use" mixtures for performing a wide range of nucleic cused as "ready-to-use" mixtures for performing a wide range of nucleic cused as "ready-to-use" mixtures for performing a wide range of nucleic cand/or restriction analysis, e.g., for the diagnostic detection of components needed to perform a particular reaction, hybridisation of components needed to perform a particular reaction, already deposited in reaction vessel, which eliminates the need for multiple additions consported and stored at ambient temperature without significant loss (amblify regions of human papillomavirus (HPV) genomes in order to camplify regions of human papillomavirus (HPV) genomes in order to characterise their type. Primers MaZ75142-MaZ75143 are PCR primers used to amplify a 450 bp region designated II which is shared by all HPV constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Stabilized reaction mixture containing an enzyme, useful for performing nucleic acid reactions, includes three-component stabilizing mixture

                                                                                                                       The present invention relates to complexes between Saccharomyces cerevisiae Selected Interacting Domain (SID (RIM)) proteins and coding sequences. The protein complexes of S. cerevisiae are useful in drug development, in screening drugs or agents that modulate the interaction of proteins, for developing yeast strains with better secretion yield of protein, and in gene therapy. The protein complexes, polypeptides and polynucleotides are useful for preventing or treating Candida infection, cancer or neurodegenerative diseases in humans or animals. The present
                                                                                                                                                                                                                                                               drug screening or development, secretion yield of protein, or infection or cancer) -

                                                                                                                                                                                                                                                                                                                                         The invention relates to a complex between two interacting Saccharomyces cerevisiae polypeptides, comprising two Selected Interacting Domain (SID polypeptides as bait and prey proteins. A pharmaceutical composition comprising the complex is useful for preventing or treating Candida infection, cancer and neurodegenerative diseases in a human or animal, preferably in a mammal. This sequence represents DNA encoding a SID

                                                                                                                                                                      The patent is for a rapid in situ hybridisation assay for detecting and typing human papilloma virus (HPV) in non-frozen cellular smears fixed t a support in absence of aldehyde-based crosslinking reagents. The assay comprises: (1) combining nucleic acid in the sample with at least one detectable probe able to hybridise with 1 or more HPV types; and (2) detecting presence or absence of hybrid complexes. Opt. several probes are used, eg one for HPV types 6 and 11, associated with benign warts, and one for types 16, 18, 31, 33 and 35, associated with cervical cancer. The assay can differentiate between HPV types. It is esp. used as a secondary test. The probes can be synthesised or cloned.
                                                                                                                                                                                                                                                                                                                                                                                                    Hybridisation test for human papilloma virus in cuby reaction with long labelled probe specific for virus types, esp. for examining cervical smears

Contreras RH, Eberhardt ī, Luyten WHML, Reekmans ŖJ;

New isolated nucleic acid representing a synthetic Bax gene, useful as medicament for treating, preventing and/or alleviating yeast or fungal infections or proliferative disorders, or for preventing apoptosis in certain diseases 2002-667002/71. DB; ABG93037.

Claim 36; Figure 1; 344pp; English.

This invention describes a novel nucleic acid representing a synthetic Bax gene. The Bax gene of the invention is useful for identifying Bax-resistant yeast or fungi, identifying, or obtaining and identifying. identifying

The products of the crivention have cytostatic, fungicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The isolated nucleic acids, polypeptides, pharmaceutical compositions, and isolated nucleic acids, polypeptides, pharmaceutical compositions, and isolated nucleic acids, polypeptides, pharmaceutical compositions, are useful as medicaments or in creating a medicament for treating, preventing and/or alleviating creatises associated with yeast or fungi or proliferative disorders, such as cancer, or for preventing apoptosis in certain diseases. The compounds creating a medicament for modifying the endogenic flora of humans and other mammals. The vaccine is useful for immunising against yeast or fingal infections. Apoptosis related diseases include autoimmune disease, this sequence represents a polynucleotide associated with the Bax gene contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

The polynucleotides are used as probes for genetically and physically mapping genes that they compose, and as markers for traits linked to those genes, where such information may be used in plant breeding to develop lines with desired phenotypes. The nucleic acid fragments may be used to isolate cDNAs and genes encoding homologous proteins from the same or other plant species, and in polymerase chain reaction (PCR) protocols to amplify longer nucleic acid fragments encoding homologous genes from DNA or RNA. These may also be used to create transgenic plants in which the polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleotide sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 530 BP; 156 A; 123 C; 98 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                overexpressed or suppressed, and as probes in direct situ hybridisation ({\tt FISH}).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inosine. Mutations in these genes cause disruptions in the catabolism of adenosine and AMP. In humans, this may lead

The AMP deaminase and adenosine deaminase may be used to prepare antibodies to these proteins, and to design or identify herbicides that inhibit their enzyme activities. The polynucleotides are used as probes for genetically and physically mapping genes that they compose, and as markers for traits linked to those genes, where such information may be used in plant breeding to develop lines with desired phenotypes. The nucleic acid fragments may be used to isolate cDNAs and genes encoding homologous proteins from the same or other plant species, and in polymerase chain reaction (PCR) protocols to amplify longer nucleic acid fragments encoding homologous genes from DNA or RNA. These may also be used to create transgenic plants in which the polypeptides are overexpressed or suppressed, and as probes in direct fluorescent in situ hybridisation (FISH).
The present invention relates to the genomic sequence of Pyrococcus abyss1 and P. abyss1 proteins (see AAB96053-AAB96842). P. abyss1 is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is a fragment of the genomic sequence of P. abyss1. The 5' end of this sequence overlaps with the 3' end of AAH41226
                                                                                                                              Claim

밁 Q

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABP4131-ABP55305), and also encompasses polypeptides 90% identical and polypucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polypucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polypucleotides and preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and

/note="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was dispested with XbaI and one nucleotide was
added by fill in in the recessive 3' end. The genomic DNA
was nebulized, end repaired, adaptor ligated and size
fractionated using sephadex. The resulting fragments were
between 0.8 and 3 kb and were cloned into the vector
(.x/y reads in M13mp19, .b/g reads in pUC19). The same
ligation was transformed in either JM107 or DH5a. "
